

**INCREASING GROWTH
AND PRODUCTIVITY WITH
HIGH QUALITY DAIRY
COW CONCENTRATES**

KOUDIJS DAIRY CONCENTRATE AS THE BASIS

By providing cows with high-quality feed, dairy farmers achieve optimal milk production from a healthy herd. A high quality dairy concentrate is the basis for the preparation of good feed and maximizing overall farm performance.

ONE BAG OF CONCENTRATE FOR THE WHOLE LACTATION CYCLE

Koudijs dairy concentrate offers versatility, allowing dairy farmers in Kenya to effectively feed their cows using a range of raw materials. This flexibility results in high milk production and ensures the health and well-being of your cows. With this concentrate, you can increase results throughout the lifecycle of your dairy cows. The amount of feed you need to give depends mainly on their milk production. High productive cows at the start of lactation need more feed than lower productive cows later in their lactation stage.

USING KOUDIJS DAIRY CONCENTRATE

De Heus and Koudijs concentrates are formulated to contain all essential nutrients, including vitamins and minerals, required for optimal cow health. By combining

these concentrates with raw materials available to you in the appropriate ratios, you create customized feeds according to the lactation stage of your cows.

It is important to use the mixing instructions and feeding table to ensure accurate and balanced nutrition for the cows throughout the production cycle. This is how you meet the specific dietary needs of your cows and achieve optimal results in terms of health and milk production. The mixing instructions can be found on our website in the dairy section: www.deheus.co.ke/animal-nutrition/ruminants/dairy

To ensure you feed the right levels of dairy meal during the whole lactation follow the guidelines as shown in the table below. Feed your cow 1 kg of dairy meal per 2 liters of milk, with a maximum of 12 kg and a minimum of 3 kg per cow. To further optimize your results use the High Productivity (HP) mixing instructions for cows producing more than 20 L of milk and the regular dairy meal mixing instruction for all other cows, including the dry cows and heifers from 6 months of age onwards.

Milk production per cow	Amount of Dairy meal per cow
24 liters or more*	12 kg
6 to 24 liters*	1 kg dairy meal per 2 liters of milk
0 to 6 liters	3 kg

*- Use the HP mixing instruction for cows producing >20 L

EACH FARM IS UNIQUE

Every farm has its own goals, challenges and raw materials. De Heus Kenya ensures high quality Koudijs dairy concentrates are available in shops across the country.
